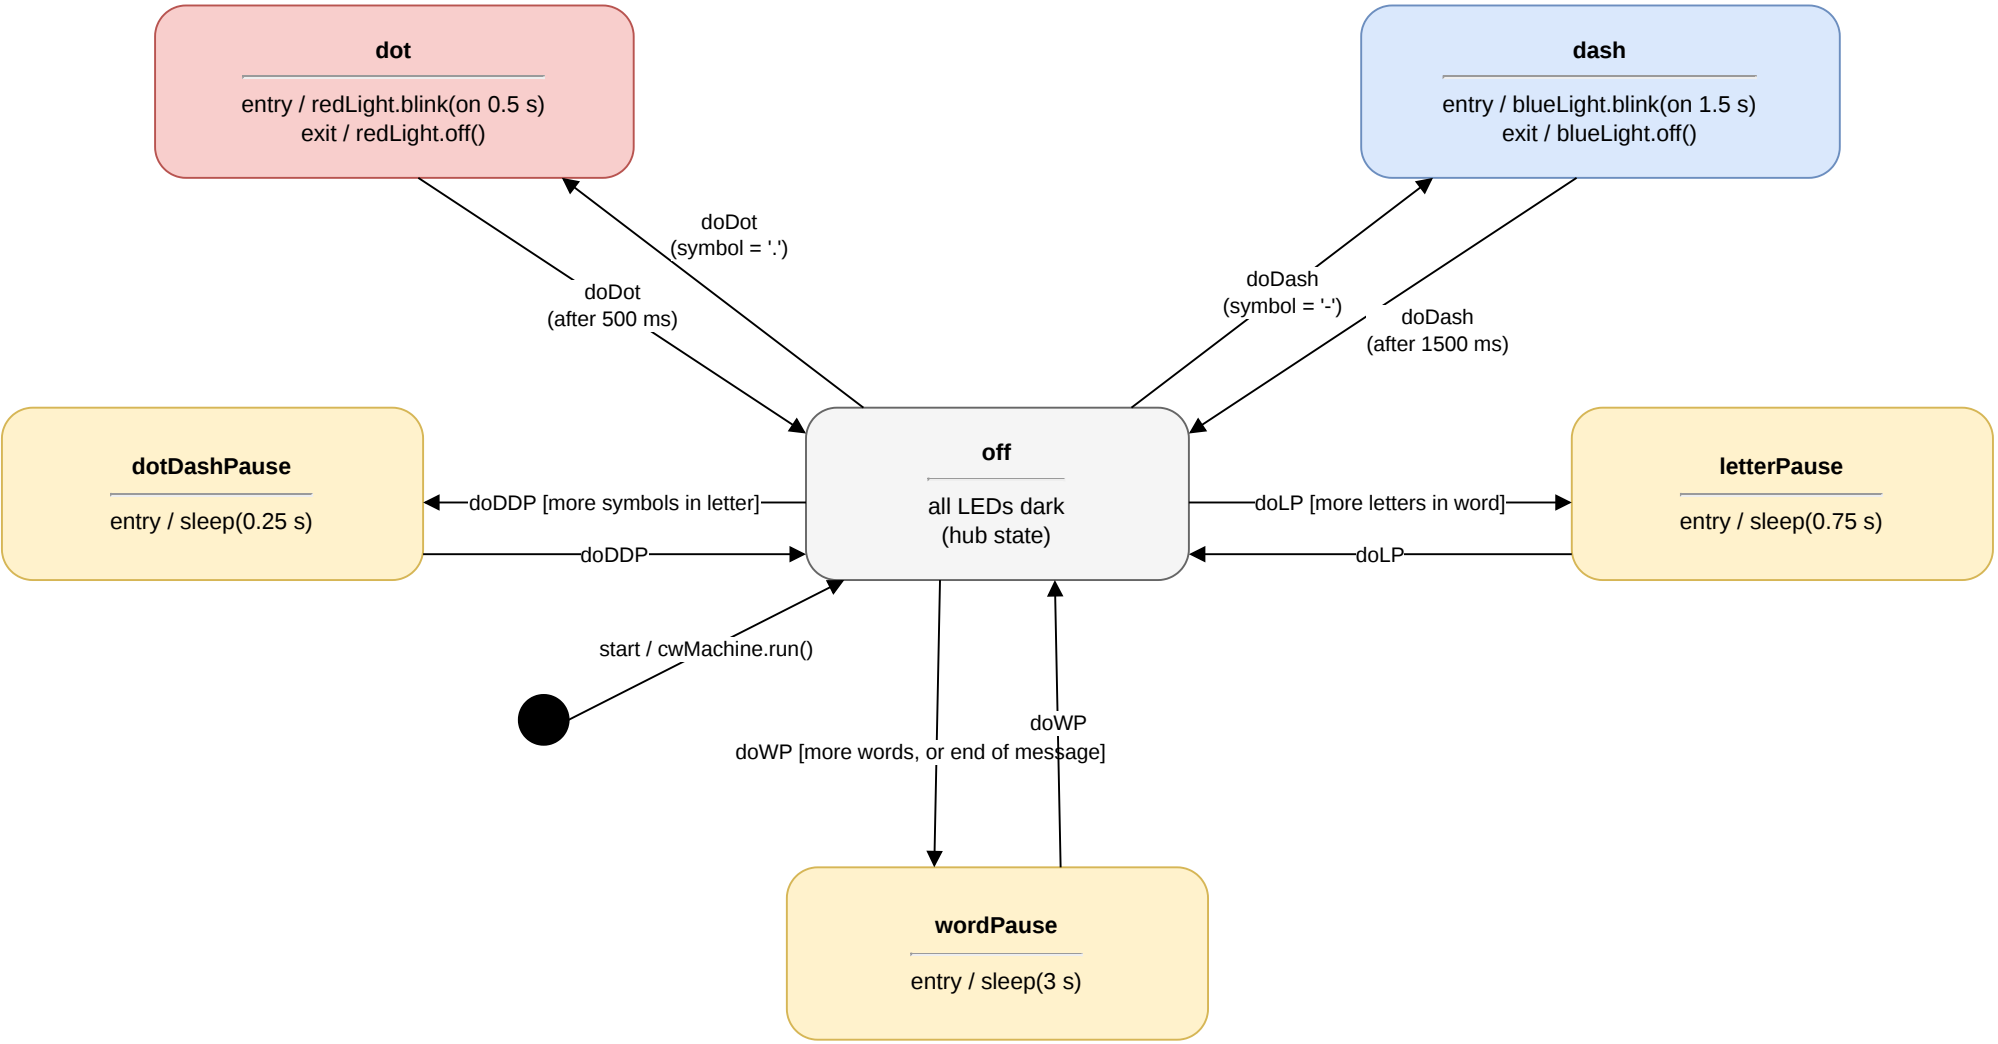
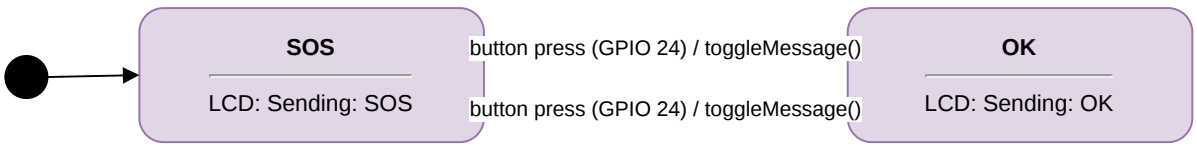
CWMachine State Machine (Morse Code Transmitter)

CS 350 Milestone Three | Luca Formento



Message selection (runs alongside the transmitter)



Notes

- transmit() runs in its own thread and sends each event twice: once to enter the state, once to return to off.
- A button press only changes activeMessage. The current pass finishes, and the new message starts on the next pass (LCD shows Next: ...).
- Ctrl-C sets endTransmission; the thread finishes the message, clears the LCD, and GPIO is released.
